## Fast Scans on Key-Value Stores

Prof. Manos Athanassoulis

https://bu-disc.github.io/CS561/

#### Fast Scans on Key-Value Stores (KVS)

Key-Value Stores are designed for *transactional* workloads (put and get operations)

Analytical workloads require efficient scans and aggregations (typically offered by column-store systems)

Can we do both in one system?

## Why combine KVS and analytical systems?

cheaper and cheaper storage

more data ingestion

need for write-optimized data structures

what about analytical queries?

## Both transactional and analytical systems

Most organizations maintain both

- transactional systems (often as key-value stores)
- analytical systems (often as column-stores)

requires additional expertise and management (e.g., two DBAs)

harder to maintain (more systems, more code)

time consuming data integration/transfer

## Goals of this paper

Bridge the conflicting goals of *get/put* and *scan* operations

get/put operations need sparse indexes
scans require locality (relevant data to be packed together)

we will discuss how to compromise, via the design of *Tellstore* 

how to amend the SQL-over-NoSQL architecture for mixed workloads

## SQL over NoSQL

Snapshot Isolation Layer

Storage

Layer

Support for: Scans Versioning Batching

Elasticity

#### Scans

# Versioning

# Batching

selection

projection

(simple) aggregates

shared scans remember them? multiple versions through timestamps

garbage collection

batch several requests to the storage layer

discarding old versions during scans might be costly amortize the network time

scans vs. get/put

# Challenges

scans vs. get/put

#1, John, 2/4/88, Boston, v1

#1, John, 2/4/88, Cambridge, v2

scans vs. versioning

versioning reduces locality in scans

checking for the latest version in scans needs CPU time

<u>scans vs. get/put</u>

Challenges

scans vs. versioning

scans vs. batching

batching **multiple scans** or **multiple put/get** requests is ok

but ...

batching scans and puts/gets is a bad idea!

puts/gets need fast predictable performance

scans inherently have high and variable latency

**Key design decisions** 

(A) Updates

(B) Layout

(C) Versioning

**Key design decisions** 

(A) Updates *in-place* 

**Key design decisions** 

(A) Updates *in-place log-structured* 

**Key design decisions** 

**Key design decisions** 

(A) Updates *in-place log-structured delta-main* 

(B) Layout

column

PAX (columnar per page)

Key design decisions

(A) Updates *in-place log-structured delta-main* 

(B) Layout column (PAX) row

Key design decisions

(A) Updates *in-place log-structured delta-main* 

(B) Layout *column (PAX) row* 

(C) Versioning *clustered* 

Key design decisions

(A) Updates *in-place log-structured delta-main* 

(B) Layout *column (PAX) row* 

(C) Versioning *clustered* 

chained

**Key design decisions** 

(A) Updates *in-place log-structured delta-main* 

(B) Layout *column (PAX) row* 

(C) Versioning *clustered chained* 

what comes as a result of versioning?

Garbage Collection (GC)

(A) Periodic *separate dedicated thread(s)* 

(B) Piggy-backed GC during scans

*increases scan time but frequently read tables benefit* 

avoids re-reading for GC (since data is already accessed)

Design Space Updates Versioning Layout GC Х Х column (PAX) periodic *in-place* clustered chained piggy-backed log-structured row delta-main

hybrid designs are also valid! should we consider all possible designs?

some combinations do not make sense:

log-structured & column < delta-main & column
log-structured & clustered < log-structured & chained</pre>

note that each combination here represents multiple options

# TellStore-Log

one log per table (locality for scans)

inserts, updates, and deletes are all logged

#### lock-free hash table

## **TellStore-Log Insertion**

#### the log contains *rows*

## TellStore-Log Update

### TellStore-Log Delete

the log contains *rows* 

# TellStore-Log Garbage Collection

during scan, health (% of invalid entries) per page is calculated if health < threshold, page is re-written in the head of the log &

update hash table & old page is reclaimed

the log contains *rows* 

# TellStore-Log in a nutshell

log-structure: efficient puts
hash-table: efficient gets (always points to the latest entry)
snapshot Isolation: high throughput, no locks needed
self-contained log: efficient scans (valid from/to needed)
lazy GC: Optimize tables that are scanned

#### four data structures

#### **TellStore-Col**

# TellStore-Col Layout

fixed-size data is stored in columnar format

variable-size data is index in columnar format but stored in row-wise format

why row-wise?

(1) faster materialization (contiguous copying)

(2) less metadata (one offset for many columns)

## **TellStore-Col Versioning**

### **TellStore-Col Insertion**

#### TellStore-Col Update

#### TellStore-Col Update

# TellStore-Col Garbage Collection

dedicated thread (conversion from row to column)

all main pages with invalid entries

all pages from insert log + update to main

run GC frequently + truncate logs

## TellStore-Col in a nutshell

*delta-main:* compromise between puts and scans *hash-table:* efficient gets (always points to the latest entry, may need one more pointer to follow) *PAX layout:* minimize disk I/O, maintain locality for scans *separate insert/update logs:* efficient GC *eager GC:* improve scans

#### Implementation Details

#### Implementation Details

efficient predicate evaluation via code generation and predicate pushdown

 $q_1: a < 4 \land (a > 0 \lor b > 20)$ 

all queries in CNF

0 0 1 1 V<sub>1</sub> 20 20 materialize for  $q_2$ Λ Λ 10 10 4 4  $q \land$  $\boldsymbol{q}$ V V > Λ Λ a a 0 0 9 9 materialize for  $q_1$ Λ  $\wedge$ a D a a r0 0 0 11 1 0 1 r0 0 0 r0 ... **r1** r1 0 0 0 **r1** 5 0 0 1 0 ... r2 r2 1 r2 0 0 0 0 0 1 1 ... ... ... ... ... ... ... ... ... ... ... ... **Result Matrix B' Initial Matrix B** Data

 $q_2: a < 4 \land b > 10$ 

#### Experiments: Transactional Workload

Figure 8: Exp 1, Throughput: YCSB, TellStore Variants and Kudu, Vary Storage Nodes

Kudu is used as it was the most competitive to begin with

All TellStore approaches are not that far!

BOSTON

UNIVERSIT

#### Experiments: Scans

#### several orders of magnitude

Figure 10: Exp 3, Response Time: YCSB#, Vary Storage Nodes

Q3 does not have projections, so no benefit from columnar

#### Experiments: Mixed Workload

#### Figure 11: Exp 4, Response Time: YCSB# Query 1, 4 Storage Nodes

Contrary to competition, scan perf. is stable with more gets/puts In the absence of updates TellStore scales perfectly: scans+gets go to different cores With 50% updates eventually logging wins

## Things to remember

KVS vs. Scans: how to compromise, navigate the design space

✓ delta-main vs. log-structure
 ✓ chained vs. clustered versions
 ✓ row-major vs. column-major
 ✓ lazy vs. eager GC
